

ABSTRACT

An envelope includes a rear panel and a front panel with a closure flap. The front and rear panels are connected by an expandable sidewalls formed by joining end flaps of the front and rear panel. The sidewalls have an intermediate line of weakness
5 that allows bending and expansion. A liner is secured to the rear panel and forms a relatively small pocket and a relatively large pocket within the envelope. An additional pocket or receptacle is joined to the rear panel. The envelope is especially suited for receiving photographic film or digital storage means when delivered to the retailer for processing and for returning photographic prints, negatives and/or digital
10 media to the consumer.
